

Oncology In Vivo Data Integration for Hypothesis Generation

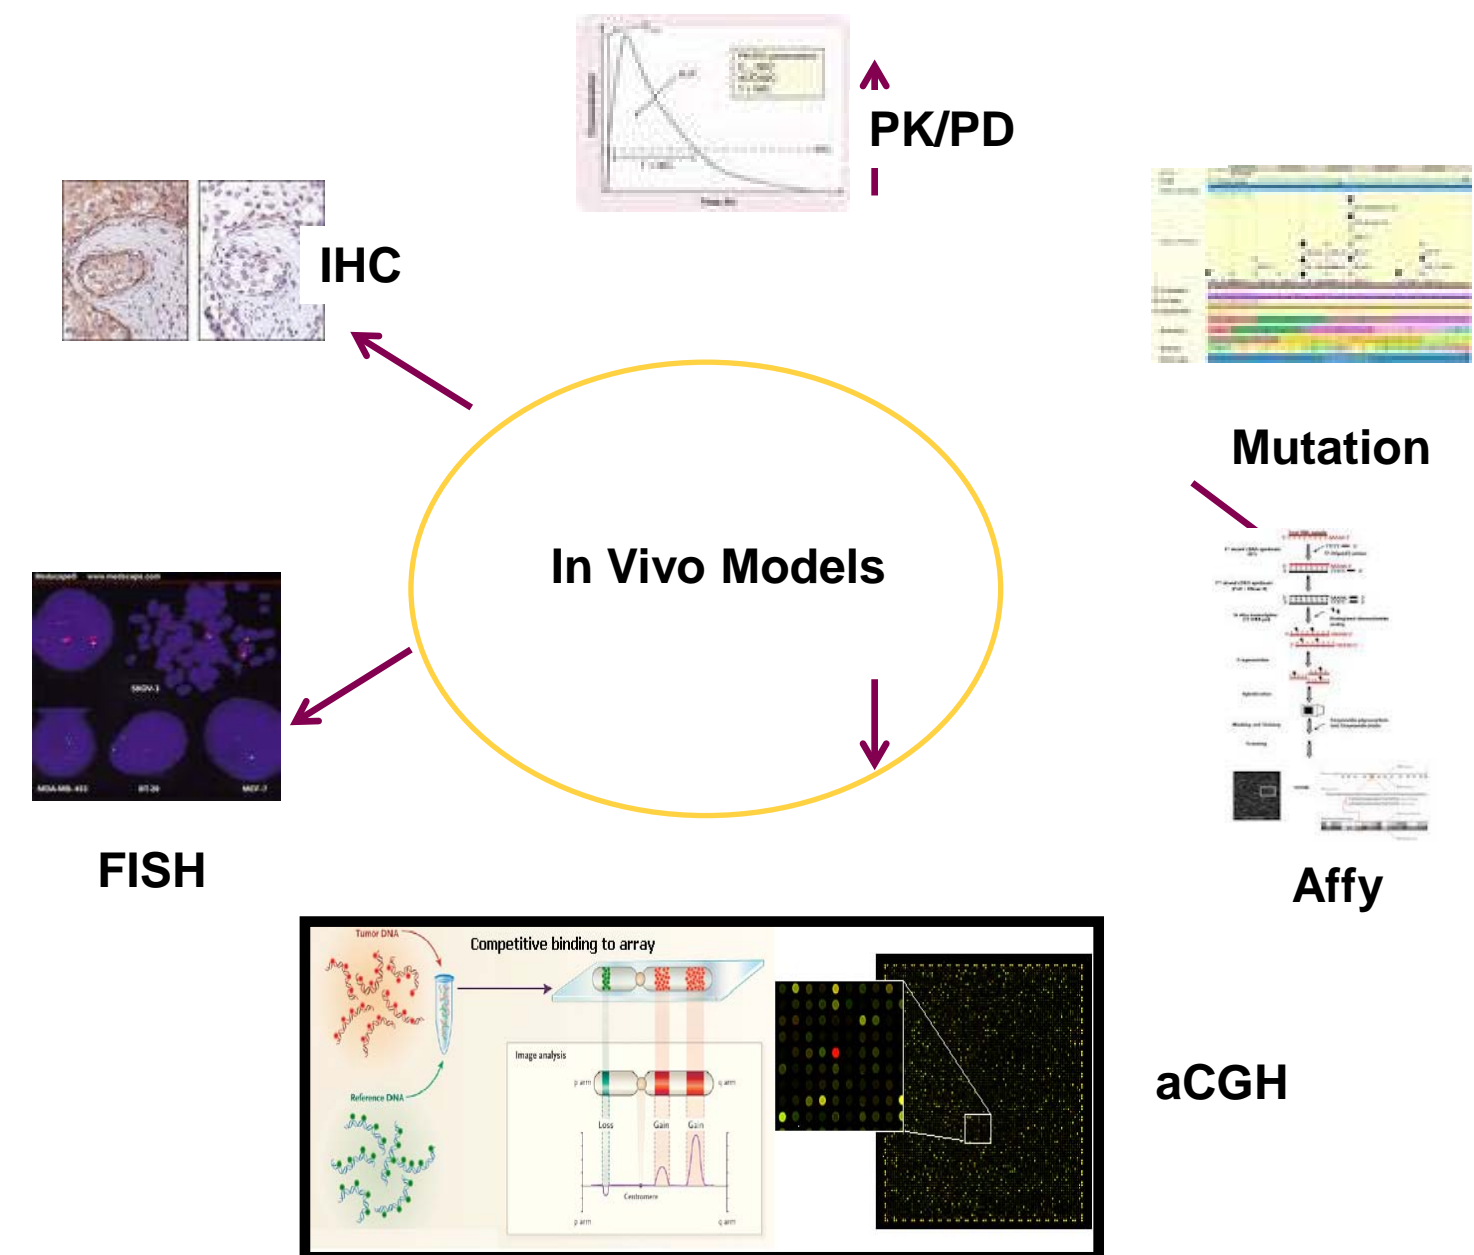

Jia Wei, Ming Chen

AstraZeneca Innovation Center China, Building 7, No.898 Halei Road, Zhangjiang Hi-Tech Park, Shanghai 201203, China

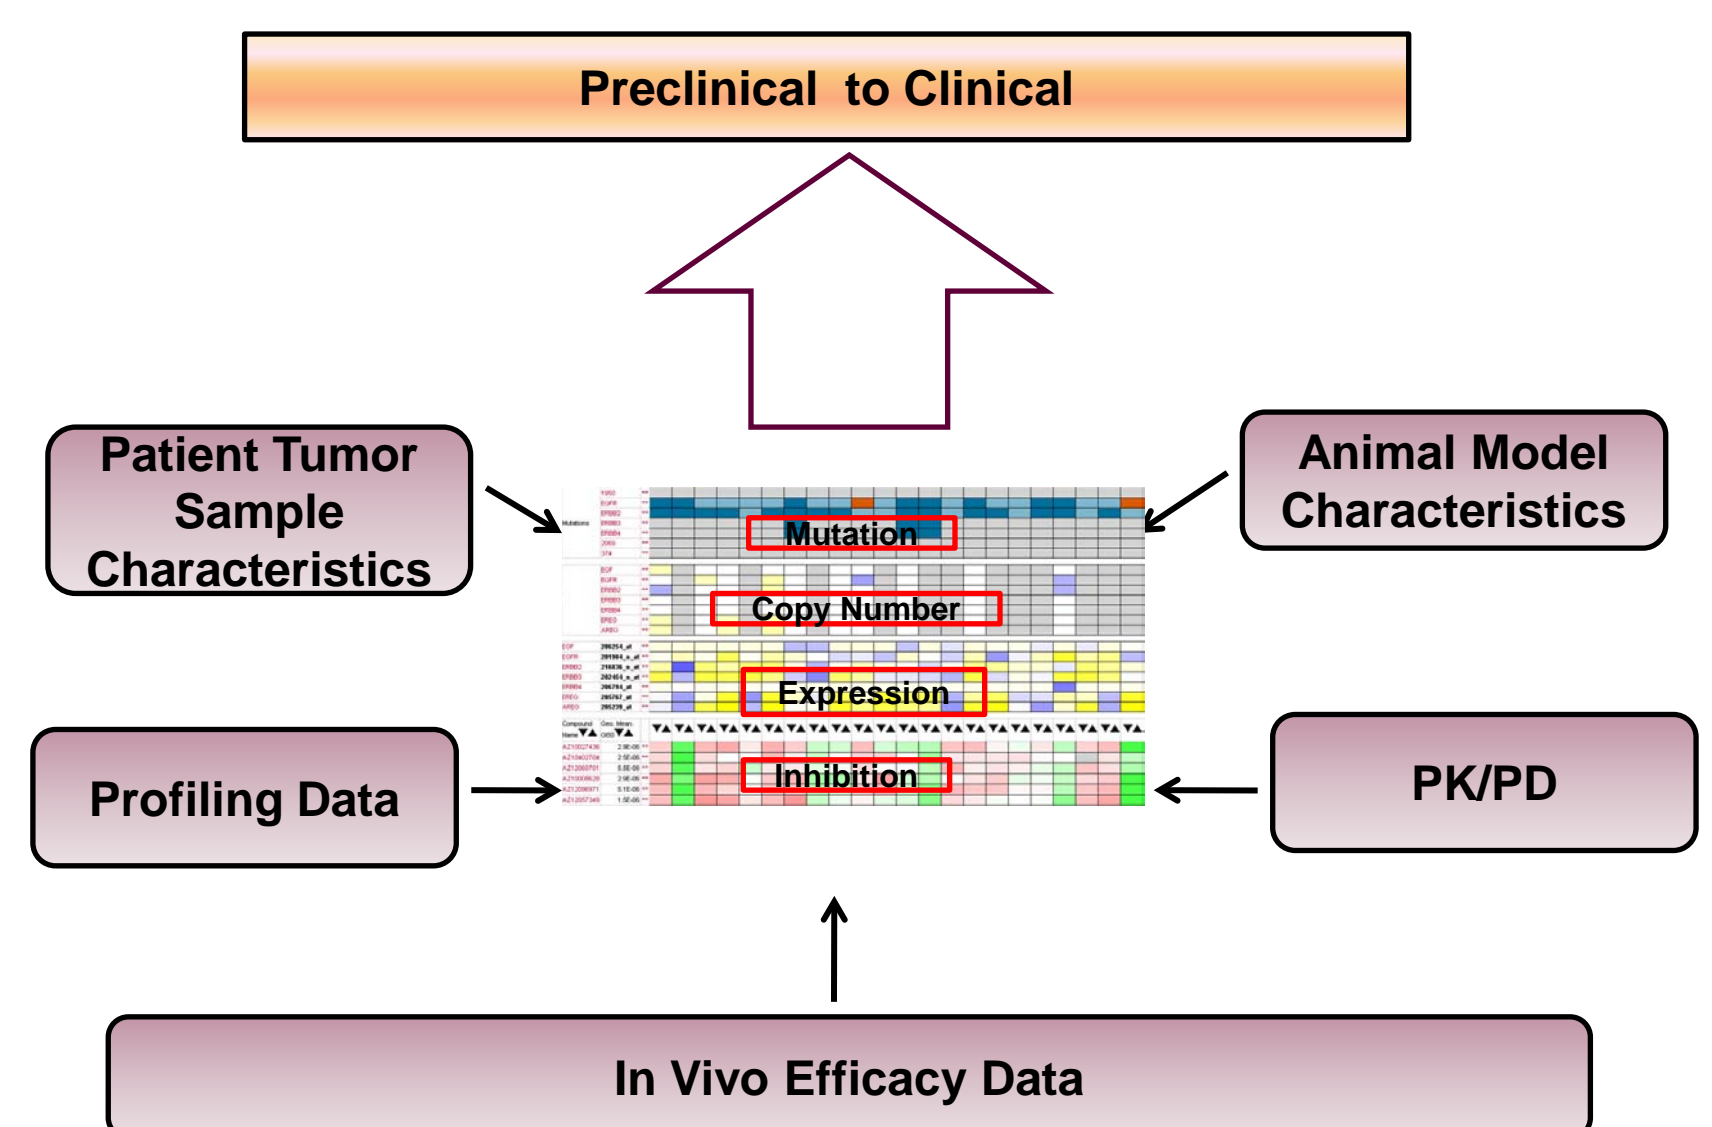

What is InVivoDB?

- A web tool to manage all the Oncology In Vivo studies
 - Provide integrated data collection, analysis and storage solution to support In Vivo animal studies
 - Enable fast data retrieval through searchable framework and beat the 24hr challenge
 - Enable efficient data exploitation and data sharing across AZ sites
- Provide data integration, visualization and analysis capability to facilitate hypothesis generation and prediction from preclinical to clinical
 - Provide single point access to diverse data types
 - Efficacy, tolerability and PK/PD data
 - Animal model information with Genetics and Genomics profiling data
- Benefits
 - Correlate molecular characteristics to in vivo efficacy
 - Identification of responsive animal models
 - Evaluate compound selectivity and MOA
 - Determine disease response (Tumor type)
 - Compare efficacy between AZ and competitor compounds
 - Support target validation

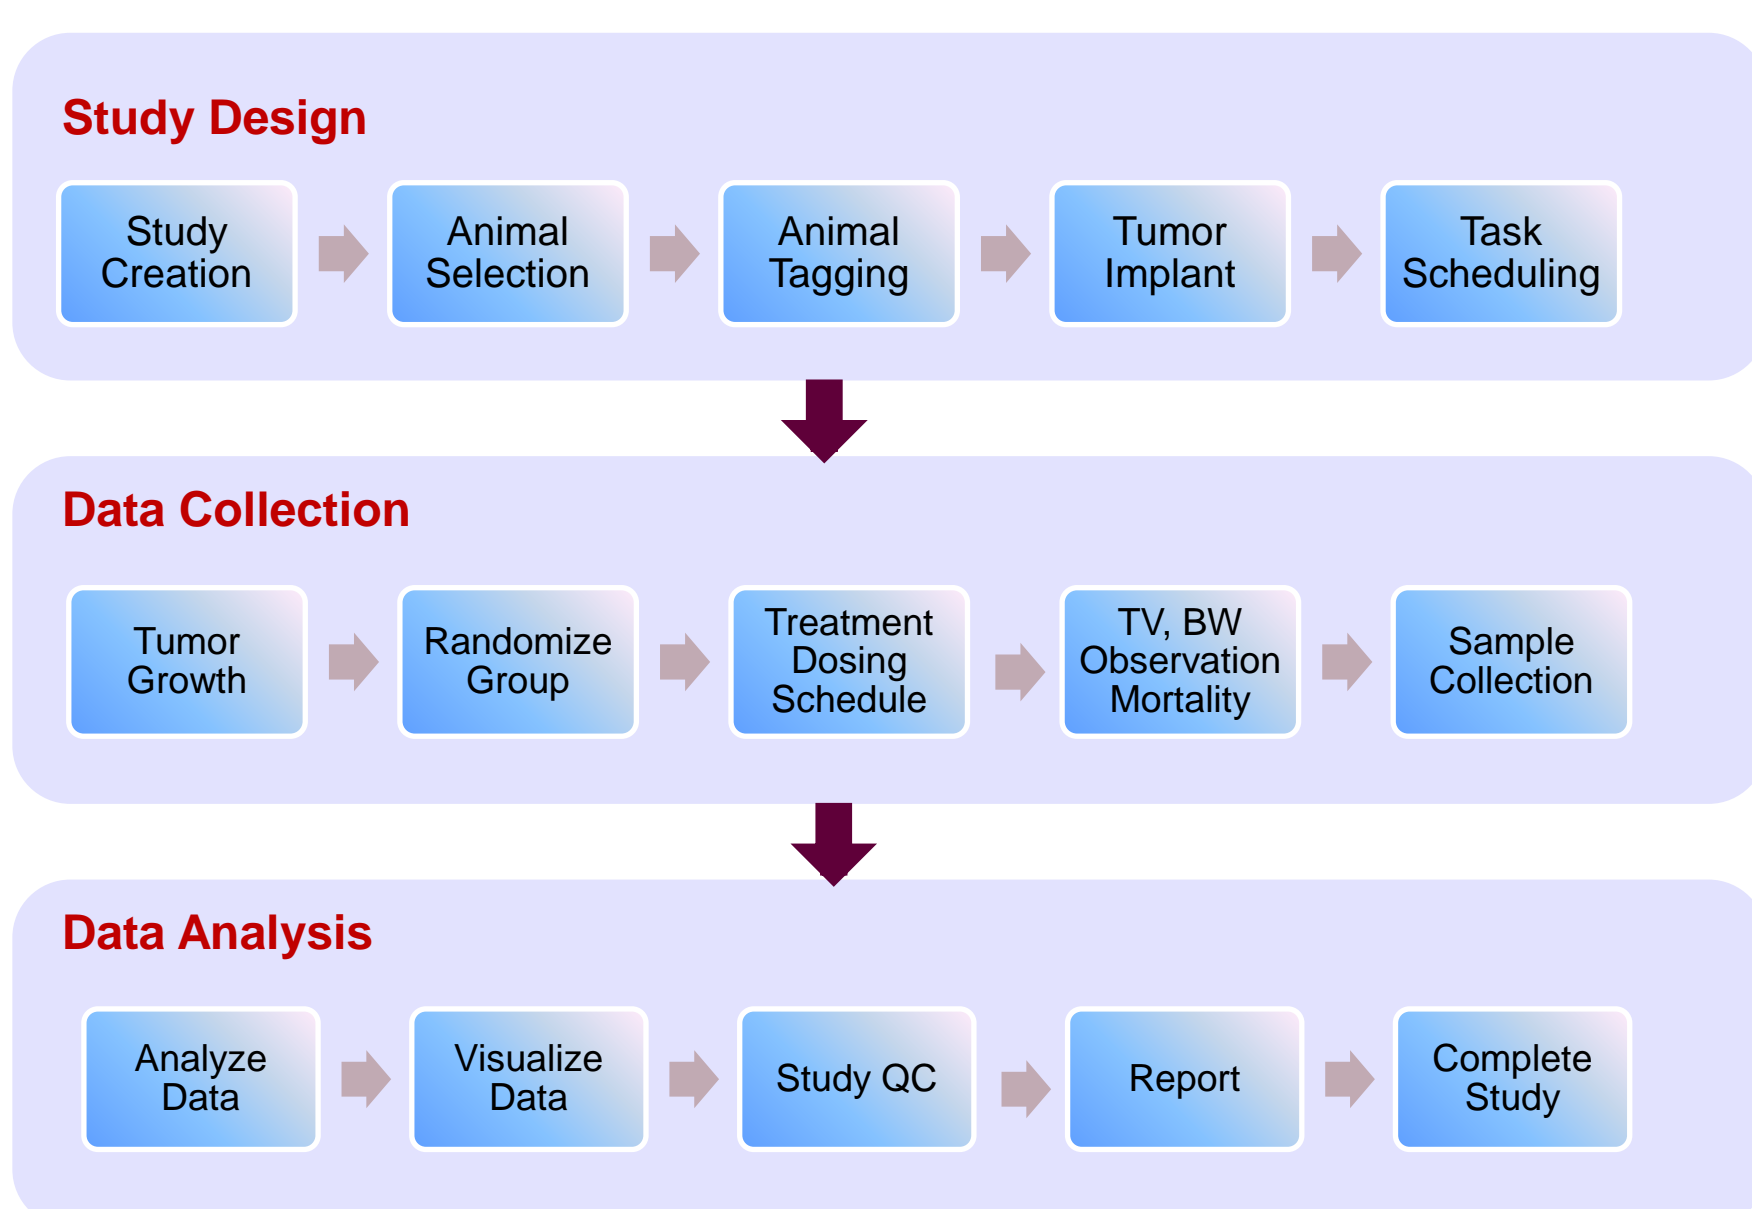

Supported Data Types

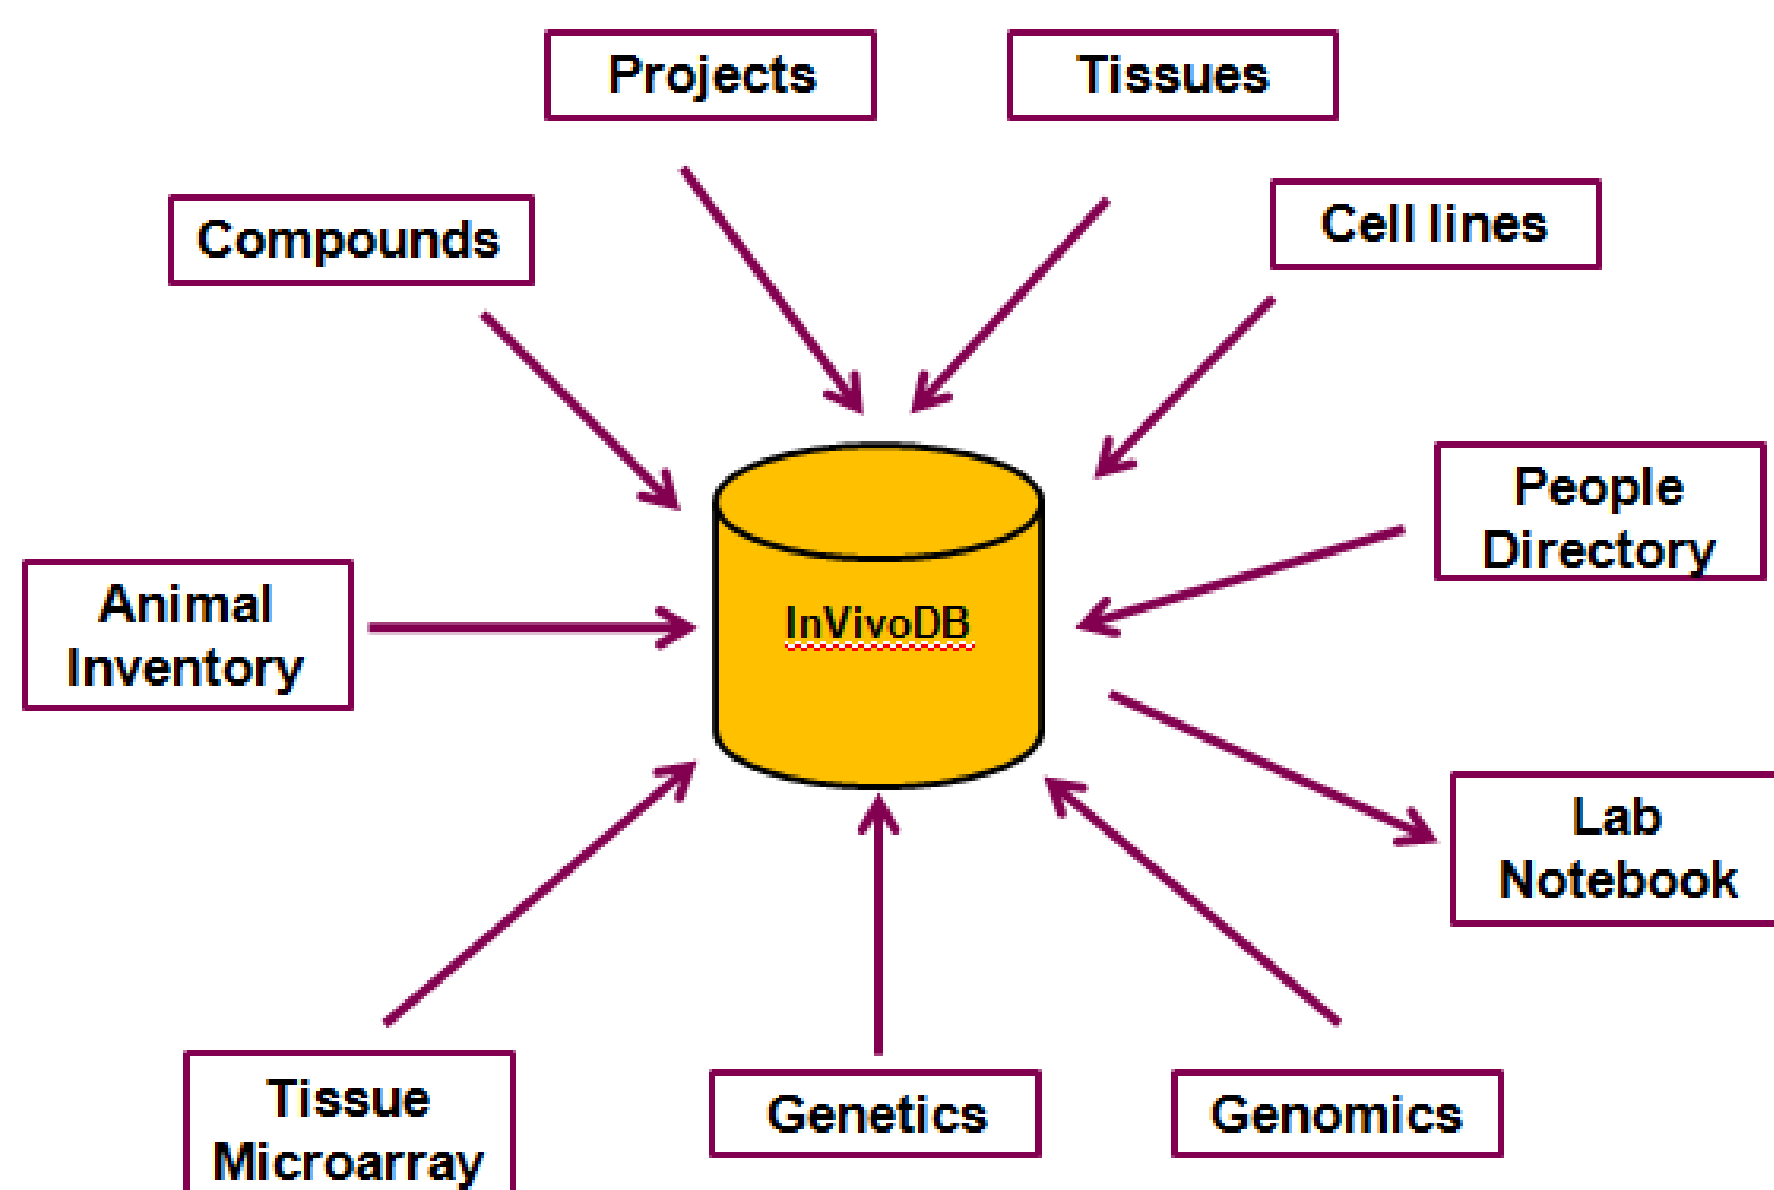

In Vivo Data Clustering for Hypothesis Generation

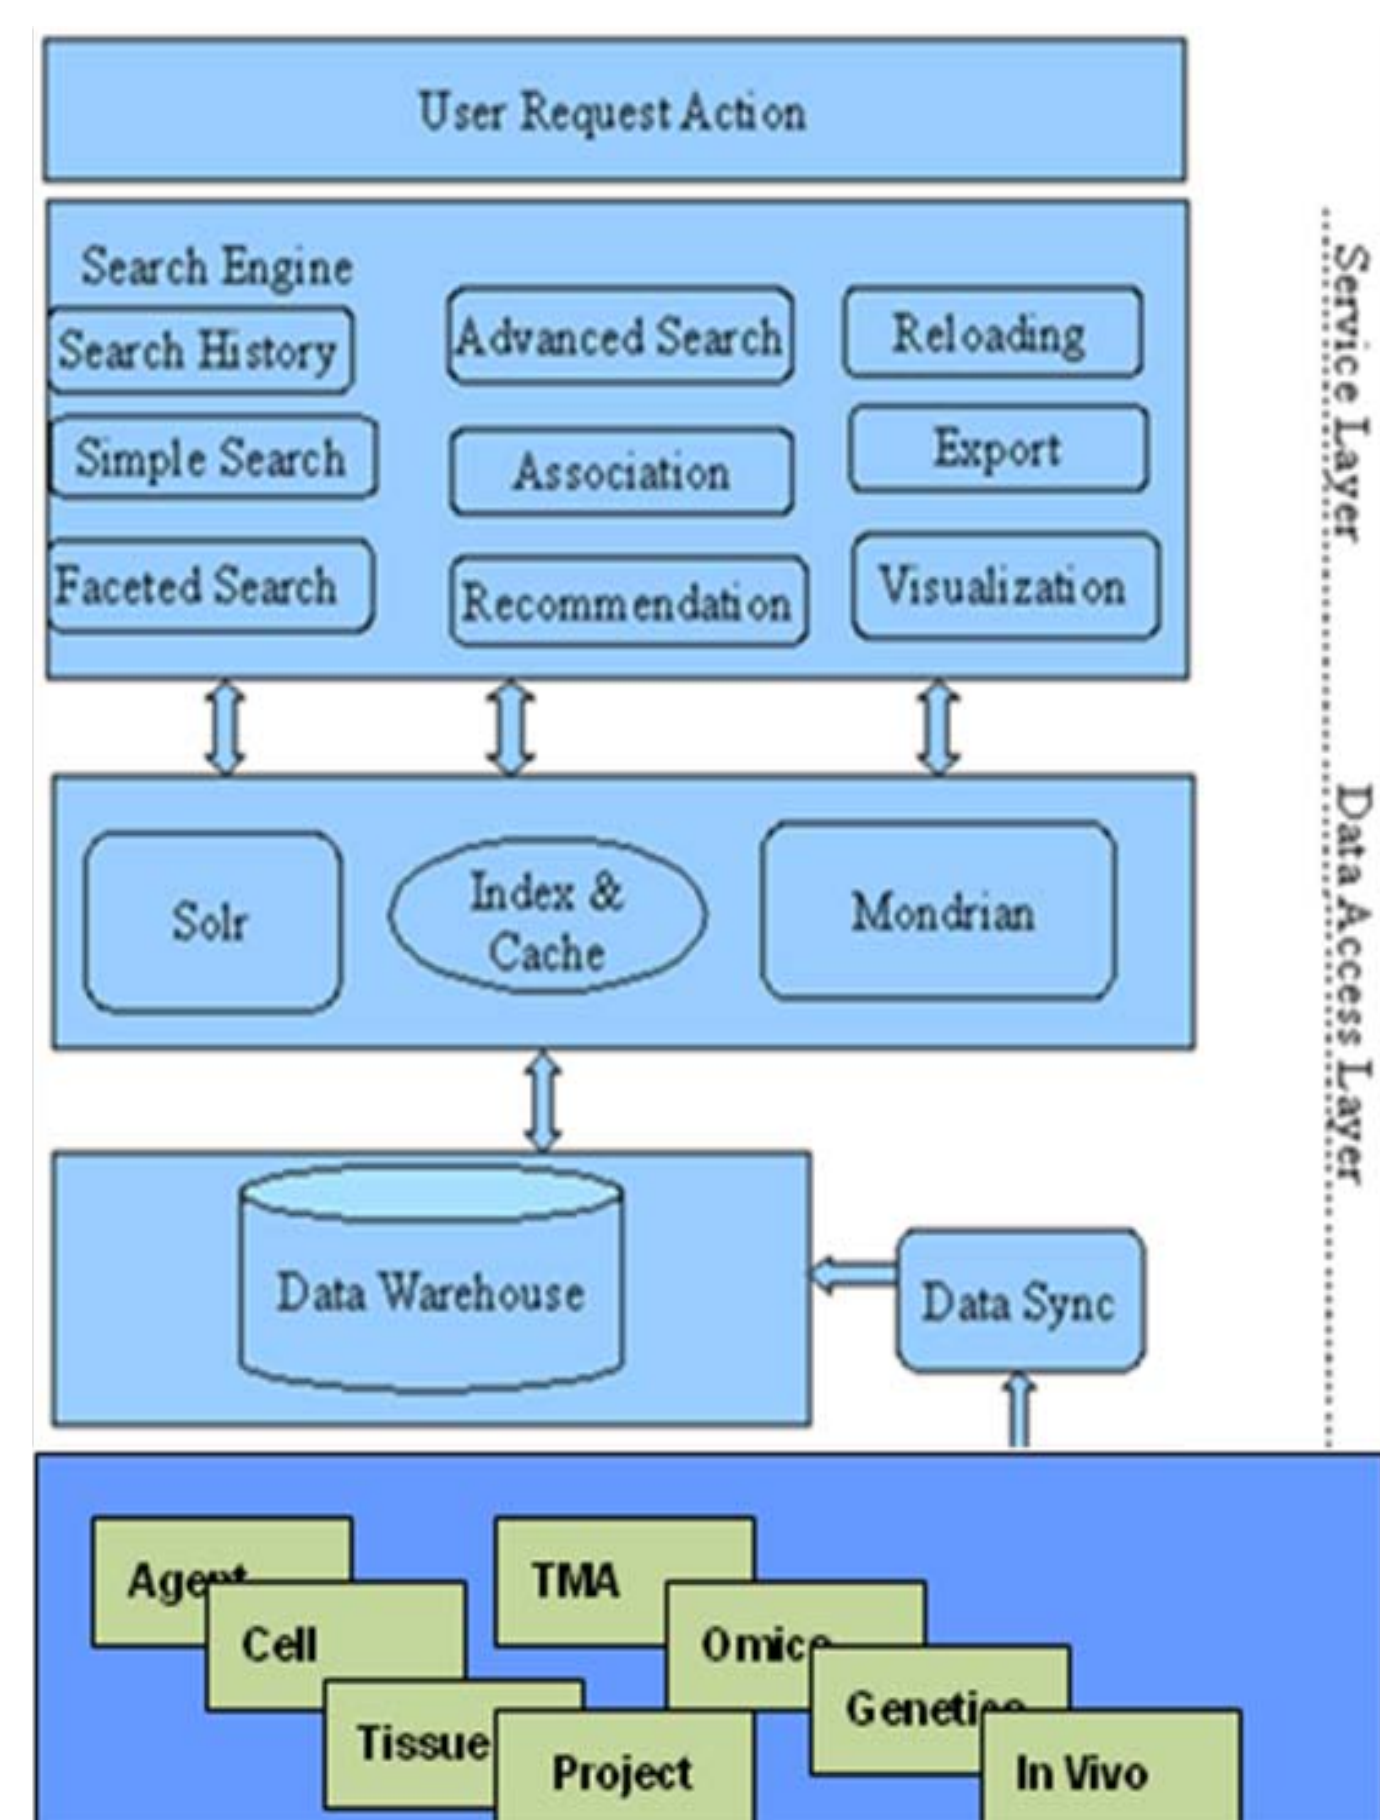

InVivoDB – Animal Study Data Workflow

InVivoDB Interactions with other AZ Systems

System Architecture

Acknowledgement

We sincerely thank AstraZeneca in vivo scientists Jingchuan Zhang, Steve Wedge, Sharon Pearsall and Maureen Hattersley for helping us with application design and system review. We thank AstraZeneca statistics scientists Ping Zhan and Robert Shaw for statistical analysis support. We also gratefully acknowledge the support of Augmentum for system development.
